

Transforming Outlook: Copilots CoS value proposition in Outlook

Outlook UXR POV paper, 17th February 2025

Background:

With the One Outlook approach and IDC's increasing focus on Copilot—spanning areas such as Copilot+ PC, Copilot Agents, Tasks, Security Agents, OOF Agents, and Actions—this research paper aims to provide IDC with insights into user-led opportunities for Copilot x Outlook initiatives. It synthesizes findings from various research reports conducted over the past year or more, highlighting unique opportunities where Outlook and Copilot can drive meaningful impact.

A key consideration is that fundamental user needs remain consistent, yet we are at a pivotal moment at Microsoft where Copilot's capabilities can help address long-standing gaps and user challenges more seamlessly. This paper explores user expectations for an intelligent CoS assistant like Copilot, particularly in areas where IDC is focusing its efforts. Additionally, it examines how Copilot can contribute to the One Outlook vision, ensuring a unified experience for users, regardless of the endpoint they choose to access Outlook from.

Introduction:

Today's information workers are navigating an increasingly complex communication landscape. With professionals using eight or more different platforms—including email, chat, document commenting, planning tools, and departmental apps—staying on top of critical messages has never been more overwhelming. The sheer volume of emails, chat notifications, and cross-platform updates has led to an urgent need for smarter, more integrated solutions that help cut through the noise and focus on what truly matters.

Outlook, with its deep ties to M365, is uniquely positioned to address this challenge. By leveraging AI-powered automation and intelligent prioritization, Outlook can transform from a static email client into a proactive assistant—one that helps users regain control over their communications, stay focused, and make better-informed decisions. The future of work demands not just more communication but smarter communication, and Outlook is poised to lead that transformation.

1. Let's understand Copilot from a M365 lens

Copilot in Microsoft 365 is envisioned as an AI-powered assistant that provides transformative, context-aware assistance to users across their workflow. It aims to go beyond simple task automation to deliver personalized context aware insights and suggestions that help users

focus on their core priorities and goals. As per user expectations, the one Copilot experience should also aim to be contextually aware of the users on-going workflows agnostic of which 1P, 2P or 3P apps they use to get their work done.

Users expect Copilot to understand their unique needs and work styles, seamlessly integrating into their existing tools and processes. They anticipate Copilot will play multiple roles depending on their situational needs. This support is expected to evolve over time as Copilot learns more about each user's specific role, tasks in hand, team dynamics, and business objectives. Ultimately, users hope Copilot will help them work smarter by providing intelligent assistance in the flow of work, surfacing relevant information at the right time, and even handling some responsibilities autonomously with the appropriate oversight and control.

1.1 Users' expectation from Copilot

- **Deep Personal Understanding:** Users expect Copilot to develop a comprehensive understanding of their role, work patterns, and preferences. This isn't just about knowing job titles - users want Copilot to grasp the nuances of their responsibilities and relationships. As one user expressed: *"Do not take over my apps. Be my side chat & be contextually aware of what I am doing. So that I can ask it to do anything I need, without having to explain the context."*
- **Proactive Intelligence:** The expectation goes beyond reactive & ondemand assistance. Users want Copilot to anticipate needs and potential issues before they arise. So that, it helps them be more effective and error free at work.
- **Seamless Integration:** Rather than disrupting existing workflows, users expect Copilot to enhance their current processes by integrating in their workflows and current ways of working seamlessly. This includes automatic generation of summaries, drafts, and suggestions within their natural processes.
- **From Tool to Partner:** Users are moving away from seeing Copilot as just another feature and instead view it as an intelligent partner in their work.
"I want it to always be on top of things: Copilot should be aware of my context, who I am, my work, etc and give me suggestions & help me be smart."
- **From Manual to Automatic:** There's a clear preference for proactive assistance over manual invocation. Users expressed that
"Speed is a serious barrier – so the time it takes to click and wait for feedback decreases the likelihood that I would use features."
Different kinds of features require different degrees of intervention; on-demand (copilot is manually triggered), proactive (copilot anticipating needs), and automatic (copilot takes independent action)

In an overwhelming digital landscape filled with multiple apps, notifications, emails, and chats, users need a way to stay on top of their tasks and efficiently manage their workflow. They require tools that help them get things done easily, quickly, and precisely—without feeling lost in

the constant stream of information. This means providing them with smart prioritization, contextual organization, and proactive assistance to reduce cognitive overload and help them focus on what truly matters.

1.2. Our vision of Copilot in Outlook - as Chief of Staff

Based on the users' expectations from an AI tool, we think of Copilot in Outlook as playing different roles at different times. It will provide each user with the equivalent of a team of agents that will in turn make for a smart AI powered CoS assistant : This will help people accomplish their work - providing active assistance in flow, connecting the dots for them, and working on their behalf & along with them based on their need for support and assistance in various contextual flows. Copilot will do this while evolving a deep understanding of the customer's context: the needs of the business, their current projects, the landscape of their team, and who can perform parts of the customer's job when delegated. It will be a clear leap forward in employee capability and competency, not simply focused on time savings.

Copilot would provide the following value to users:

- Copilot as CoS helps users effortlessly stay on top of their inbox with Catchup Digests and keeps them organized with Reminders
- Copilot as CoS is their active thought partner and sidekick, sitting beside the user and super-powering them as they work:
- Users can delegate jobs to Copilot as if they were an entire team, no longer working alone.
- As users work with Copilot, it evolves with them over time by building memory. This is transparent, and easy to manage and tune.

OPPORTUNITY AREAS

2. Outlook x Copilot Task management opportunities

Problem: To help users navigate an overwhelming digital environment, Copilot in Outlook can act as a CoS assistant that simplifies workflows, prioritizes critical information, and reduces distractions. With the constant influx of emails, notifications, and tasks spread across multiple communication platforms, users struggle to identify what requires immediate attention and what can wait. They heavily rely on peers and their own understanding of constantly evolving streams of workstreams & timelines in multiple on-going workflows and tasks to make sense of work to be done.

Opportunity: Copilot can streamline this by assisting in proactively triaging emails to surface high-priority messages, and summarizing key takeaways to minimize the effort needed to stay informed.

Beyond managing emails, users need a structured way to optimize their time and focus on tasks that matter. Copilot can assist by intelligently planning schedules, suggesting focus time, and dynamically adjusting calendars based on evolving priorities. (This could be in the calendar or email body itself). For ongoing workflows, Copilot can provide smart recommendations, automate repetitive responses, and integrate across productivity tools to ensure seamless task execution, even when work happens beyond Outlook.

Since every user’s workflow is different with its own unique complexities, Copilot must offer customization, autonomy and control. Allowing users to tailor AI assistance to their needs—whether through suggested actions, automated follow-ups, or fine-tuned email drafting. By balancing automation with user input, Copilot can help users get things done efficiently, stay organized, and focus on what truly matters—without getting lost in the noise.

2.1 Jobs To Be Done (JTBD) in Outlook

JTBD	Pain Points
 Triage incoming messages to prioritize important items	• Users struggle to stay on top of high message volume, leading to missed priorities or constant fire-drills. They need help identifying urgent and important items, distinguishing action items from FYIs, and batching similar messages to streamline processing. The challenge is particularly acute with high volume. "I have 2,266 unread emails. I have learned to ignore that but trying to figure out how to actually go in and clean stuff just kills me. So, I avoid it further."
Scanning and processing emails after time away	• Users need help with catching up with what happened during their absence and assessing new progress. Many users report feeling overwhelmed upon return. Lack of structured catch-up time leads to feelings of being swamped on day one • Users struggle with following and responding to long threads and forked conversations where context can be easily lost. <i>"I'll get emails where they're like looping me in and it's been like a whole email chain before that. And I'm like,</i>

	<i>oh, God, can somebody just please tell me what happened here?"</i>
 Compose thoughtful, contextual responses efficiently	Writing effective emails is highly time-consuming, especially when significant context-gathering and wordsmithing is required in formal communications where editing once sent is not possible. Users need Copilots help in quickly grasping background details and structuring their response. Finding the right tone in email communication presents ongoing challenges, particularly for non-native speakers. It can be stressful and time consuming.
 Manage calendar and schedule effectively	Heavy meeting loads and complex stakeholder coordination lead to suboptimal calendaring and lack of focus time. Users need help strategically prioritizing meetings, reserving time for core work, and adapting schedules as conflicts emerge.
 Find and resurface emails & relevant information quickly	Navigating siloed messages, documents and data to find key information is an ongoing challenge that disrupts workflow. Users need a more intuitive way to search and discover important content across their inbox, calendar and files.

2.2 User Perceptions and Needs

Information Workers (IWs) and IT Decision Makers (ITDMs) consistently describe Outlook as "Anxious, chaotic, risky, isolated." Many compare it to a "ghost town" or the "Wild Wild West" where they feel overwhelmed by constant demands. In contrast, these same users envision an ideal Outlook as "Calm, organized, light, teamwork", an experience that helps them feel "level-set for the day" and gives "insight into what I need to prioritize." This gap between reality and aspiration presents a significant opportunity for Copilot to transform the Outlook experience from one of dread to one of confidence and control.

Outlook's Current Strengths

- 1. Formal push communications:** Outlook excels as a platform for formal business communications, providing structure and legitimacy to important messages. Users recognize that it's has a formality to it that makes Outlook valuable for professional correspondence. This formality, however, can make Outlook less adaptable to casual, flexible communication styles that many users prefer for day-to-day interactions.

2. **Integrated with M365:** Outlook's integration with other Microsoft 365 applications is viewed as a significant advantage. Users appreciate that it syncs with their calendar and other tools, creating a cohesive ecosystem. However, this integration can sometimes feel overwhelming, with notifications appearing across multiple platforms simultaneously.
3. **Organize & archive:** Outlook provides robust organizational tools that help users manage their inboxes through folders, filters, and rules. Users value how it separates out the focused emails and other emails and appreciate the ability to sort the emails and put them in different groups. The challenge is that these capabilities require significant time and effort to set up and maintain. Additionally, the search functionality often falls short, reducing Outlook's effectiveness as an archive system.

Outlook's Future Potential

Through research, several high-priority areas emerged where Copilot can substantially enhance the Outlook experience:

TRAFFIC CONTROL: Manage my inboxes and calendars

1.  **Organize/Prioritize Messages:** Group, prioritize and surface messages. Including cross platform and non-Microsoft integration
 - *Prioritize My Inbox* represents the top opportunity, as users desperately need better organization of their currently overwhelming communications and help prioritizing what's most important. While users recognize the potential value, they emphasize that Copilot must learn from their personal habits to prioritize correctly.
2.  **Scheduling Support:** Draft suggested meeting invitations and times or re-scheduling suggestions that work to optimize attendance.
 - *Time Agent for scheduling/re-scheduling* offers intelligent calendar management, suggesting optimal meeting times and handling rescheduling when conflicts arise. While users seek suggestions to help with meeting times, they express caution about fully automated rescheduling, questioning how Copilot would know what meetings are important or can be rescheduled. ITDMs show more enthusiasm for this feature than IWs.

EMAIL OPTIMIZATION: Assist me in drafting emails

3.  **Fine Tune Emails:** Embedded grammar and tone optimization that gives them fluency in a medium that does not match their communication style
 - *Coaching my communications (Write w/ Me)* addresses the identified need for assistance with email as a communication medium. Many professionals already use tools like ChatGPT or Grammarly and welcome additional help with tone, clarity, and precision. Users particularly value assistance with finding the right tone in email communication, which presents ongoing challenges, especially for non-native speakers.

4.  **Generate Responses:** Generate draft responses or templates for repetitive and easy requests based on the Information Worker's past responses.
 - *Automatically respond to easy asks (Delegate)* allows users to offload repetitive communications to Copilot. This capability directly addresses the need to counteract platform proliferation and notification overload. The ability to delegate time-consuming but low-value communications to Copilot allows users to focus on more meaningful work and strategic thinking.

SOURCE OF TRUTH: Keep me in the know

5.  **Track To-Dos:** Integrated and automated tracking of follow ups and outstanding tasks across individuals, teams and projects.
 - Though not initially highlighted, *tracking tasks and to-do's* emerged as a key opportunity for users who struggle with tracking multiple action items across platforms, teams and projects. Users need an integrated view that collects action items scattered across emails, meetings, and documents, bringing everything into a centralized, prioritized task list.
6.  **Contextualization:** Summaries of information including email threads, past meetings, and relevant documents that quickly bring IWs up to speed..
 - *Digests/briefings* is the ability to delegate time-consuming and repetitive communications to Copilot allows users to focus on more meaningful work. This capability directly addresses the need to counteract the effects of platform and notification proliferation.

Beyond these core capabilities, several additional opportunities can further enhance the Outlook experience:

1. **Searching across communications platforms:** Users need solutions that address communications holistically, not just within individual channels. Copilot can "connect the dots" across platforms.
2. **Less formal or 'fun and delightful' ways of communicating:** Bringing more casual communication options to Outlook can help balance the platform's tendency toward formality while preserving its professional strengths.
3. **Grounding / training to help AI learn and 'get it right':** Ensuring AI feels personalized to the user's needs is especially important given the personal nature of email/calendar.
4. **User focus and control:** Keeping user autonomy at the forefront ensures Copilot optimizes for users' mental health—reducing overwhelm rather than adding to it.

Top Concerns with AI in Communications

For Copilot integration to deliver transformative value, several critical concerns must be addressed:

- **Worried about GenAI's history of inaccuracies:** Users express concern about potential errors and emphasize the need for reliable performance.

- **Concerned with GenAI's ability to understand context or prioritize correctly:** For truly valuable assistance, Copilot must understand the nuance of the user's role, industry, and enterprise context.
- **Need for control / being kept in the loop:** Maintaining appropriate oversight is consistently emphasized, particularly for features like scheduling, delegate emails, and review responses.
- **Need for training and learning from personal habits:** Copilot must adapt over time, providing increasingly personalized assistance that aligns with individual working styles and preferences.

By addressing these needs and considerations, Copilot has the potential to transform from a source of stress to a trusted partner that helps users manage their communications effectively and reclaim their time for higher-value work.

3. Outlook x Copilot Out of Office (OOF) agent opportunities

Before Leaving Phase

User Story	Unmet needs	Feature Suggestions
As an employee planning leave, I want to review and categorize all my ongoing tasks, so that I can ensure critical work is handled during my absence.	 HMW help users feel more in control of their tasks to close before going on leave?	• Auto-generated to-do lists with task priorities and deadlines
As an employee planning leave, I want to identify and either complete or properly pause tasks that only I can handle, so that there are no blockers while I'm away	 HMW help users close their tasks or delegate them effectively?	• Help prioritise tasks & free up schedules to get focused work time to finish work that needs to be closed.
As an employee planning leave, I want to effectively hand off appropriate tasks with clear documentation and context to equip my colleagues who will cover for me, so that work can continue smoothly in my absence		• Contextual peer connect suggestions based on work areas. • Automated communication templates with delegation details

As an employee planning leave, I want to set up comprehensive out-of-office notifications across all relevant platforms, so that stakeholders are properly informed about my availability and alternative contacts	🔧 HMW help users easily communicate about their absence?	
--	--	--

During Leave Phase

User Story	Unmet needs	Feature Suggestions
As an employee on leave, I want flexible notification controls so I can stay informed about truly critical issues	🔧 HMW help users stay on top of the most critical updates only?	• Critical updates digest with configurable frequency
As a team member, I want to maintain work-life balance while ensuring business continuity	HMW help users ease into their time Off without guilt?	• Customizable notification filters for different disconnection levels

Return to Work Phase

JTBD	Unmet Needs	Feature Suggestions
As a returning employee, I want to quickly understand what happened while I was away across chats, calendar, documents & emails, so that I can effectively resume my work without missing critical updates.	🔧 HMW help users ease into their work without feeling overwhelmed?	• Proactive digest with key updates and summaries • Concise summaries of key conversations or decisions with relevant links (e.g., meeting recordings, shared files). • Updates section showing timelines and sprint progress • Surface emails from close collaborators
As a returning employee, I want to connect with my peers & join meetings to get started quickly	📅 HMW help find dedicated time to get things done effectively?	• Proactively blocking the calendar on return for focused catching-up, cleaning inboxes and chats • Scheduled 1:1s with key stakeholders

		• Surface emails from close collaborators and critical stakeholders.
As a returning employee, I want to efficiently organize and prioritize my accumulated tasks, so that I can structure my day effectively and focus on what matters most.		• Action items with contextual summaries and due dates to help plan their day with critical items that could be picked up first in order of priority. • Surface urgent RSVP items and deadlines to unblock stakeholders • Populate next steps directly into task management systems with options to: a. Schedule meetings b. Block calendar time. c. Prioritize based on urgency.
As a returning employee, I want to identify and address high-priority action items, so that I can unblock others and handle time-sensitive matters first.	 HMW help users prioritize their tasks effectively?	• Surface important items that need their RSVP responses & set reminders for critical deadlines.
As a returning employee, I want to quickly sort through messages directly addressed to me, so that I can respond to urgent requests and maintain communication flow		• Prioritise inbox to make email checking efficient • Direct links to important emails/documents/recordings • Highlight @mentions and direct emails as priority items as these are the primary items users look for after returning.
As a returning employee, I want to thoroughly review and understand missed items and tasks, so that I can ensure no important details or decisions are overlooked as I catch up	 HMW help find dedicated time to get things done effectively?	• Contextual summaries linking related content • Meeting recording highlights • Integration with task management systems • Proactively blocking the calendar for focused catching-up, cleaning inboxes and chats

*This study was done with few internal stakeholders only. A bigger UXR study needs to be planned with users outside of Microsoft across different levels of hierarchy.

3.1 Principles when designing for OOF scenario:

1. **Proactive Assistance:** Provide automated catch-up summaries so users don't have to search for updates. Prioritize actionable insights such as critical mentions, pending approvals, and meeting summaries. Offer intelligent delegation options, allowing users to assign tasks before leaving and track their status upon return.
2. **Minimize Cognitive Overload:** Structure catch-up workflows to surface only relevant and high-priority information. Filter and summarize emails, chats, and updates rather than presenting an overwhelming backlog. Help users quickly triage and act on key updates without needing to sift through non-essential content.
3. **Seamless Work Resumption:** Enable dedicated catch-up time by suggesting blocked focus sessions upon return. Provide context-rich summaries that highlight key decisions made during the user's absence. Facilitate peer reconnection by suggesting key stakeholders or meetings to attend first.
4. **Flexible Communication Management:** Allow users to define their availability levels (fully disconnected vs. available for urgent matters). Enable auto-responses with smart delegation, ensuring important requests are handled without manual intervention. Reduce disruptions by muting non-essential notifications while surfacing urgent ones.
5. **Contextual Awareness:** Use role-based prioritization to determine what information is most critical for each user. Recognize dependencies and blockers, ensuring users are aware of issues requiring their input. Tailor recommendations based on past interactions, highlighting emails and messages from key collaborators & anything that is directly addressed to the absent user.
6. **Trust, Autonomy & Control:** Provide customization options for auto-responses, catch-up digests, and delegation preferences with different levels of automation and responses on behalf of the user. Ex. Response shared to someone outside of the organisation may be very limited to tagging a delegated peer in the users absence. While, responses to a close peer / manager may include working files on behalf of the user (if the user allows for such content to be shared).

4 Task prioritization & Email triaging opportunities

The challenge of task prioritization when triaging emails has consistently emerged across multiple studies. This remains a

significant pain point for users and presents an important opportunity area for Copilot to provide intelligent assistance where it is most needed.

1. Gaps in Email Prioritization Feature

- The biggest concern is in around accuracy, users feel as if the feature might incorrectly prioritize an email. This could prove counterproductive as users can feel inclined to over-triage to make sure Copilot did not miss something.
- Priority labels vs priority based grouping provide distinct value. Priority labels help identify what to read first whereas grouping helps declutter the inbox and push unimportant emails away so they don't have to pay attention.
- Users naturally expressed a desire for a way to correct the model in case it made an error in prioritizing an email. Personalization & Training settings are hard to access and discover. These settings proved to be valuable and almost essential to the feature, but the current way to access them is not intuitive.
- Potentially effort-heavy: The main concern with this capability is how much effort the user will have to take in order for Copilot to accurately label emails. It can be disruptive to pause your current workflow and take time to correct Copilot. There's also the chance that priorities might change over time, and the user would have to iterate previous rules, adding to the effort involved.

"I can see the benefit – but am scared that too many things will be flagged as low priority, which might make me ignore them altogether when I should probably still check on it."

Opportunity: Providing clear explanations for why an email is marked high priority (e.g., 'This email is from your direct manager and mentions a deadline') helps build user confidence. Additionally, allowing users to fine-tune prioritization rules during their workflow based on sender importance, project relevance, and urgency would enhance adoption. Adding a 'Why is this prioritized?' tooltip could give users more visibility into Copilot's decision-making process, fostering trust and engagement. Prioritise transparency and control.

2. Gaps in Email Summaries Feature

- Users find summaries helpful for quickly digesting email threads but often report that they lack crucial context. Users also expressed concern over summaries omitting key action items or failing to capture the nuance of tone in important emails.
- In shorter emails, summaries add no value. In longer threads, unless the user has complete trust on Copilot's summary, they will still have to read the entire thread to ensure nothing is missed. Detailed summaries for longer threads may require a similar amount of cognitive effort to consume and hence do not work well for summaries. Conciseness while ensuring important information is covered is required.
- **Opportunity:** Keep summarise features on demand so users may decide when they require it thereby not being too forceful. Include "Content + action item + timeline of

response + (link for action)” in the summary structure. Moreover, enabling users to fine-tune the level of detail within summaries such as choosing between brief highlights and detailed breakdowns helps address concerns about missing information. Adding an AI-explained rationale for why certain details are included or excluded also improves transparency and user confidence. Trust building is crucial for summaries to add value.

3. Gaps in Discoverability

- Proactive AI features in Outlook can become ineffective when they remain hidden from users, potentially rendering them invisible and unused. For instance, during testing some users often did not notice the prioritization was active.

“While I have the Prioritization active it's not obvious it's on from the interface or if it's working.”

Out of sight, sadly out of mind. When a Copilot feature is 'ever-running' in the background, users don't really perceive value until they see it in action.

- Opportunity: Keep the discovery of features contextually relevant in the middle of the users workflow. So that it proactively suggests tips and assistance when the user is in the middle of getting something done. Ex. OOF agent discovery could be when a user is applying for their leave via a 2P portal, or when they are sending an email/ chat message informing their team members about going on leave.

5. Challenges when building CoS Copilot features

4.1 Lack of Trust

Accuracy Issues with Basic Information

- **Name and Role Accuracy:** Copilot frequently makes mistakes with basic identifying information like names and job titles. As one user noted: *“I mean, I've been called everything from the CEO to, well, the CIO to a department manager and I'm a support specialist.”* This type of error is particularly damaging because users expect AI to at least get these basic facts right. When such obvious mistakes occur, it makes users question the system's reliability for more complex tasks.
- **Date and Timeline Management:** The system sometimes fails to properly interpret or reference dates and timelines. One user pointed out: *“So it's, you know, I hope you're doing summer, which I'm not sure where it got that because I would think that it would at least look at the date, right.”* These temporal inaccuracies can lead to scheduling

confusion and missed deadlines, making users hesitant to rely on Copilot for time-sensitive tasks.

- **Contextual Understanding:** Users report that Copilot often misses or misinterprets important context. A participant observed: *"Draft often confuses or conflates my company and my customer when writing emails or chats."* This lack of contextual accuracy means users must spend extra time verifying and correcting outputs, defeating the purpose of using an AI assistant.

Impact on User Behavior and Productivity

- **Increased Verification Time:** Users find themselves spending more time checking and correcting Copilot's output than they would spend writing from scratch. As one user explained: *"I feel I can just prompt a better result faster on my own than the time I would spend tinkering with the refinement."* This additional verification overhead negates the potential time savings Copilot could offer.
- **Risk Avoidance:** Users become hesitant to use Copilot for important communications or complex tasks. One participant stated: *"I can't risk copilot missing a point, or not saying it in the way I have it in my mind."* This risk aversion means users often bypass Copilot entirely for critical tasks, limiting its potential value.
- **Default to Manual Methods:** Many users revert to traditional methods rather than risk errors. As expressed by one user: *"By the time I click the new email button, I already have a few points that I want to get down... Why not just draft it myself, if I already know what I want my email to say."* This behavior pattern indicates a fundamental trust barrier that needs to be addressed.

4.2 Lack of transparency makes automated actions unacceptable

Another common challenge with AI-powered tools is that their automatic actions can feel opaque and uncontrolled to users. For an agent like Copilot that aims to take proactive steps to assist users, a lack of transparency into what it's doing and why makes those actions unsettling at best and dangerous at worst. This lack of transparency in turn results in reduced trust in the tool.

When Copilot operates as a "black box":

- Users may feel uncertain about what data Copilot accesses to inform its judgements
- The boundaries of what Copilot will/won't do autonomously are unclear, leading users to worry about unintended or irreversible consequences

- There's no clear way for users to specify and adjust the guardrails for Copilot's behavior based on their risk tolerance and oversight preferences

Impact on User Behavior and Trust

- **Resistance to Automation:** Users hesitate to enable automated features when they can't understand or control their operation. Without transparency, potentially valuable automation remains unused due to fear of unexpected outcomes.
- **Constant Manual Oversight:** When automated features are used, users feel compelled to double-check every action, negating the efficiency benefits. The lack of transparency creates a persistent need to verify that Copilot is behaving as intended.
- **Reduced Feature Adoption:** The opacity of Copilot's decision-making process leads users to stick with manual methods they understand, even if less efficient. Users express that they would rather maintain control than risk unexpected automated actions.

To give users confidence in Copilot as a trusted autonomous partner, it's critical to provide high transparency into the information sources, decision frameworks, and execution parameters that guide its actions. Eg, in features like prioritise or group emails, clear communication about the logic behind prioritising should be available. This transparency eventually builds trust. Rather than functioning in opaque ways that breed suspicion, Copilot should put users in the driver's seat to authorize the nature and extent of automatic support they're comfortable with.

4.3 Learnability is essential to improve relevance over time

While Copilot's knowledge and capabilities may be extensive from the start, its ability to learn and adapt to each user's needs is what will drive its long-term relevance and impact. A static Copilot that doesn't progressively tune its behavior runs the risk of fading into the background as a generic tool vs. an integral daily assistant.

Key Learning Limitations

- **Persistent Error Patterns:** Users observe that Copilot fails to learn from corrections and feedback. As one user noted: *"I still don't really know how to use Copilot with the calendar and scheduling"* even after multiple attempts at correction. This indicates a failure to adapt to user preferences over time.
- **Limited Personalization:** The system struggles to develop an understanding of individual users' work patterns and preferences. One participant observed: *"It seems like every time I start a new draft in outlook, it forgets previous references, I don't think I should have to tell it every time to sound like me."*
- **Inconsistent Memory:** Users report that Copilot fails to maintain context between sessions. Inability to carry forward user-specific context and preferences across sessions, making interactions feel like starting from scratch each time

Impact on User Experience and Efficiency

- **Repetitive Training Effort:** Users must repeatedly provide the same corrections and preferences, creating frustration and wasted time. The lack of learning capabilities means each interaction feels like starting fresh.
- **Decreased Long-term Value:** Without demonstrated improvement over time, users perceive Copilot as a static tool rather than an evolving assistant. This perception limits investment in developing a deeper working relationship with the tool.
- **Reduced Feature Engagement:** Users become discouraged from using features that don't show improvement through use. As one user explained:
"I'm not a big fan of the draft function. I spend more time trying to edit, refresh, rewrite than just writing the email myself."

To deepen user trust and deliver multiplicative value, Copilot needs to demonstrate continuous learning at both the individual and aggregate level. Every interaction should make Copilot smarter about each user's unique needs, empowering it to provide proactive, hyper-personalized support that amplifies their strengths, offloads their burdens, and helps them level-up over time. Users should feel a strong sense of investment in "their" Copilot. Overtime, copilot should be able to understand its user better thereby providing better value in each feature like giving exact search results, prioritising mails as the user would, or writing emails in the user's tone of voice.

4.4 Multiple Copilots Creating Fragmented Experiences

The current implementation of Copilot across different Microsoft 365 applications can create a disjointed and confusing experience for users. When users encounter seemingly different Copilots in Outlook, Teams, Word, and other applications, it fragments what should be a unified AI assistant relationship. This fragmentation manifests in several important ways.

1. Each application-specific Copilot maintains its own separate understanding of the user's context, preferences, and work patterns. For example, the Copilot in Outlook might learn a user's writing style for emails, while the Copilot in Word has to learn it separately for documents. This creates redundant learning curves and prevents the development of a comprehensive understanding of the user across all their work activities.
2. The capabilities and interfaces can vary between different Copilot implementations. Users report confusion when features available in one application's Copilot are missing in another, or when similar features behave differently across applications. As one user noted: *"I tried to ask Copilot about how to prioritize my inbox and got advice about doing it manually instead of utilizing the Prioritize feature - it seems like the Copilots don't know about each other's capabilities."*
3. The lack of unified memory and context sharing between Copilots means users often have to repeat information or preferences they've already established elsewhere. This creates additional friction and cognitive load, directly contradicting Copilot's goal of reducing user effort. For instance, if a user has already explained their role and project context to Teams Copilot, they shouldn't need to re-explain this to Outlook Copilot.

4.5 Creepiness & Changing People's Existing Habits

One of the core challenges of integrating AI-powered assistants like Copilot into daily workflows is the perception of "creepiness" when the AI starts influencing or predicting user behaviors. Unlike traditional automation tools, which require explicit user input to function, Copilot aims to anticipate user needs, streamline workflows, and even suggest actions before users request them. While this proactive assistance can be highly beneficial, it also raises concerns about control, transparency, and unintended behavioral shifts. Factors contributing to this are:

1. **Perceived Loss of Control:** Users feel uneasy when Copilot starts making autonomous decisions without their explicit input. While automation is meant to simplify work, users may worry that the AI is overstepping its boundaries. Users have expressed concerns about Copilot preemptively drafting responses or categorizing emails in ways that do not align with their preferences.
2. **Breaking Long-Established Routines:** Many professionals have ingrained habits; checking emails in a certain order, drafting responses with a personal touch, or managing tasks in a specific workflow. Copilot disrupts these routines by automating steps users previously did themselves. A user who manually prioritizes emails may feel disoriented when Copilot pre-sorts them differently.
3. **Introducing a New Cognitive Load:** Instead of simply performing a task, users must now evaluate AI-generated outputs. This requires a different type of engagement; assessing whether the AI's response is accurate, appropriate, and in their preferred style. Users have noted that while Copilot speeds up some tasks, it also forces them to second-guess AI-generated content before sending or acting on it.
4. **Reducing Intentionality in Communication:** Writing an email or structuring a meeting agenda involves deliberate thought. When Copilot suggests a draft, users may send messages without carefully considering tone, nuance, or strategy. Over time, this can subtly change how people express themselves, leading to more generic or AI-shaped communication.

Impact on User Trust and Adoption

1. **Hesitation in Adoption:** Many users hesitate to use Copilot for sensitive tasks due to the uncertainty of how it operates. Trust takes time to build, and unexpected AI behaviors can slow down adoption rates. Transparency is key in building confidence in AI-driven tools. Without clear explanations of how suggestions are generated, they may opt to revert to manual methods.
2. **Resistance to Automation:** Users are more likely to reject features that feel intrusive or unpredictable. Copilot's ability to automate tasks needs to be balanced with sufficient user oversight, allowing individuals to fine-tune AI behavior to match their comfort levels.
3. **Concerns About Dependency:** Some users worry that increased reliance on Copilot could diminish their own cognitive engagement with tasks. If the AI does too much thinking for them, they may lose critical skills in writing, decision-making, and task management.

By designing Copilot to adapt to users rather than forcing them to adapt to Copilot by increasing transparency and user control, AI can become a trusted, seamless part of daily workflows.

5. Conclusion

Copilot must strike a delicate balance between automation and user control. While users desire proactive assistance that reduces their workload, they need to maintain oversight and trust in the system. This requires transparent operations, clear explanations of AI decisions, and easy ways to modify or override automated actions.

The path to transformation relies heavily on Copilot's ability to build and maintain deep contextual understanding. By comprehending users' roles, projects, team dynamics, and work patterns, Copilot can provide truly personalized assistance that goes beyond simple task automation. This contextual awareness should evolve over time through continuous learning and user feedback.

Successful implementation depends on seamless integration across the M365 ecosystem. Rather than creating fragmented experiences across different applications, Copilot should maintain consistent capabilities, shared context, and unified memory across platforms while respecting app-specific workflows.

Looking ahead, Copilot's evolution will focus on three types of assistance:

- On-demand support within users' workflows
- Proactive assistance that anticipates needs
- Automatic handling of appropriate tasks with user oversight

To achieve transformative value, development must prioritize:

- Building user trust through reliable, accurate performance
- Providing transparent, explainable AI operations
- Maintaining user control while reducing cognitive load
- Understanding users and their context deeply
- Allowing degrees of control over access to information to reduce security concerns
- Integrating seamlessly into the existing ways of working of users
- Presenting a unified Copilot identity across the MS ecosystem

As Copilot continues to evolve, its success will be measured not just in time saved, but in its ability to fundamentally enhance how users work, communicate, and accomplish their goals. By following established trust and effectiveness guidelines while remaining adaptable to user needs, Copilot can truly transform Outlook from an email client into an indispensable AI-powered Chief of Staff for every user.

What are users saying about Copilot?

1. +Teams call summary, a crowd pleaser

I'll be honest, the Copilot summary of Teams calls is a massive time saver for me. It allows me to be present and focused on calls rather than frantically trying to take notes while half listening and missing key things while I was still writing the last point. I also love how you can query copilot about a meeting, for example, "what did Ralph say about the future of work?" and it will give a list of every time you mentioned it, with time stamps to the spot in the recording. It has saved me hours of work per week, and has also helped us stay aligned on fast moving projects. Humans are flawed and we don't always remember things accurately. We could align on a call, then one person forgets or misremembers, and it's a whole thing to start all over again to get aligned. With Copilot we can easily show the receipts, remind everyone of the plan, and move on. It's been a major game changer for me in that regard. For other content creation? Def not super helpful yet.

The taking minutes thing sounds pretty useful, not that I have many Teams meetings.

Maybe you haven't had this problem, but I've found a lot of these AI systems are very prudish and get upset if you're using explicit language. That's a big problem for me since I work in criminal law and am regularly writing about crimes. Any idea if Copilot can cope with stuff like that?

ReptilianLaserbeam · 3mo ago

We only have a few copilot licenses just for this feature. It saves the need for an assistant to be on a meeting taking notes, summarizing and sending reports. No idea about the language though, as we are in finance is rare people tend to be "rough" in their meetings

2. +Search

I use it daily to find shit I know exists but cannot find anywhere. Something like "last week I spoke with someone on some team and he showed me a slide about something, find me the deck" and it'll find it. Or, "I had a conversation with someone about something last week, what did he ask me to do?" and it'll find it. Or I've got a follow up meeting with someone I'd spoken to weeks ago, so I'll ask "remind me what we spoke about" or "who's this guys again? Why are we meeting?" and it'll tell me.

Sometimes it'll respond with not the thing I'm looking for, so I'll just add more context like "no that's not it, it was in a table that said something else" and somehow it eventually finds it.

I probably don't use 99% of what it's capable of, but for that 1% it's totally worth it. I almost never need to ask someone again about something I missed or forgot, I just ask copilot.

[Reference](#)

We use it internally. It's like your own company search engine. You can ask it for documents or even to lookup information out of the documentation. It is also good at summarizing conversations and emails. I can ask it to summarize all of the emails that I got in the last 24 hours and it does a good job of telling me the important stuff.

It's great for drafting policies and procedures. You do still have to do some work to fix a lot of things but it's pretty good about giving you ideas where to start.

For coding I use 1o since Copilot is not that great with any complex coding questions.

I think it's worth it for managers and C level positions or anyone that works with a lot of information in general.

[Reference](#)

I find it really useful as a search engine for work documentation. As it has access to everything I have access to I can ask it to search for documentation covering x subject and if it exists it can find it. The ability to search across internal documentation, emails, Teams chats etc. from one place is pretty useful.

It's actually pretty good as a search engine for internet searches as well as it sources it's information. So it puts an explanation of your question together but also provides links to where it got this information. That's very useful for verifying what it's telling you if you suspect it's not quite correct. I actually prefer using Co-Pilot to a google search now as it can cut down on a lot of crap search results.

Apart from this stuff if I need a quick powershell script to do something it's a real time saver. I can have something in seconds that I can work off of as a starting point.

3. +Outlook summaries

I get a ton of email. Every morning my first step is to ask copilot to summarize all of my unread email as a to do list. It provides a nice bullet pointed list of every action item it can find with links to the specific email if I need more detail. I then right click the inbox and mark all as read. It really speeds up my day since I am able to get right down to the asks without needing to read through 40 pages of email threads. I am typically done with the list by 10Am

4. - Users are not happy about forceful opt-in

Is anyone else finding Copilot in MS Word super annoying? It's even worse than Clippy, back in the day! It's stalking me and it seems near impossible to disable. I'd like to choose when I want to use it rather than it chasing me around my document like a desperado trying to be my friend. Microsoft Office, you need to do better.

<https://www.linkedin.com/feed/update/urn:li:activity:7267089607781998593/>

I opened up my recently updated Microsoft Word to find an annoying new feature called "Draft with Copilot." Internet searches didn't lead to a way to turn it off, so I went to CoPilot on the web to find it. It actually worked. If you are looking: File>Options>Copilot uncheck "Enable Copilot." Options is at the very, very bottom of the screen.

Maybe I'm old school, but I really don't like all these companies turning these "features" on by default.

Well, surely you can just turn it off. Right?

The smartest thing Microsoft could have done was to make this initial release of Copilot an opt-in feature for a few months. They could have said, "We're excited to let everyone try this! Just click OK here!"

Instead, they turned the feature on for everyone and gave Word users a well-hidden checkbox that reads Enable Copilot. The feature is on by default, so you have to clear the checkbox to make it go away.

Also: Microsoft Office support in Windows 10 ends in October too - what that really means

As for the other Office apps? "Uh, we'll get around to giving you a button to turn it off next month. Maybe."

How do I kill my Microsoft Copilot? Users are paying for its unwanted assistance

Sam Leith

JANUARY 25, 2025 5 MINS

Remember “Clippy”? This was the “virtual assistant” that popped up whenever you were using Microsoft Word back around the turn of the millennium. You’d be in your word processor, minding your own business, and when you typed the word “Dear” and then someone’s name, this goggle-eyed paperclip would pop up on screen and say: “It looks like you’re writing a letter. Would you like help?” And at that point, you’d stop writing a letter and waste 45 minutes trying to figure out how to turn Clippy off, for good,

<https://unherd.com/2025/01/how-do-i-kill-my-microsoft-copilot/>

How do I turn off copilot when your suggested procedure fails

I have used your procedure as follows to get copilot out of my apps but to no avail.

1. In your app (for example, PowerPoint), go to **File > Account > Account Privacy > Manage Settings**.
2. Clear the **Turn on experiences that analyze your content** checkbox.
3. Select **OK**, and then close and restart the app.

I have restarted all apps, restarted my PC several times, and even used Task Manager to shut down every Microsoft application running that I can see and then rebooted. And still I see the annoying Copilot in Word all the time in Word and Onenote! Why can't we simply turn it off with a single button somewhere. I get a popup every time I open Word and Onenote and it never seems to acknowledge that I have seen it. You don't even have an option to not see the popup again! Microsoft really needs to sort this out as it is affecting productivity to the point that I JUST WANT TO SCREAM AT SOMEONE AT MICROSOFT!!!

Please sort this out or tell me what to do to very simply get rid of this ****! I don't want it.

<https://answers.microsoft.com/en-us/msoffice/forum/all/how-do-i-turn-off-copilot-when-your-suggested/052b2f43-1e8e-46aa-bd8c-4e000305c4f8>

5. - Dissatisfaction with copilot responses

Why is Microsoft Copilot too Annoying?

Significant issues with the Microsoft Copilot.

1. Firstly, it exhibits considerable lag and slowness, sometimes taking up to a minute to respond.
2. The problem of tab switching persists.
3. It frequently engages in arguments with users. Once, while attempting to solve a puzzle using different methods than Copilot suggested, it persisted in asserting that my solution is incorrect. Moreover, it attempted to invalidate my approach by providing illogical steps that doesn't make any sense. Despite this, it refused to acknowledge that my method of solving puzzle was also valid and keep arguing.
4. Frustratingly, it often responds with vague statements such as **"I can't help you with this. Thank you for understanding,"**. Like, when I asked to write a lyrics of a song. While Google Gemini did this task very effectively. More frustrating thing, it never provide any specific reasons for its inability to assist.
5. At times, it abruptly redirects the conversation with remarks like **"It's time to move on to another topic; let's start over,"** even when the current topic is appropriate.
6. It categorizes certain biological and medical inquiries as inappropriate content and refuses to provide answers. For instance, when I inquired about the recommended **** size and specifications for a healthy man as part of sex education, it abruptly terminated the conversation, suggesting a shift to another topic. Other language models like ChatGPT, Gemini, and Claude address such questions respectfully and recognize them as pertinent to sex education.
7. Today, when I requested the datesheet for my university exams, Copilot initially responded but then suddenly cleared all responses and redirected the conversation, stating, **"Hmm... let's move to a different topic."** This behavior seems to occur particularly when Copilot is generating inappropriate content, although I didn't understand what it deems inappropriate about asking for examination dates?

In conclusion, Copilot's content filtering system is very glitchy and too strict than usual. Gemini, GPT-4, Claude are more User friendly than Copilot.

<https://answers.microsoft.com/en-us/bing/forum/all/why-is-microsoft-copilot-too-annoying/4889506b-0bd9-4555-aef9-e4c9cfffcb0>

Can I remove Copilot now popping up when I try to write emails?

Copilot is an EXTREMELY annoying addition. Crashes the plane every time. I can't finish the email I'm composing when it pops up. It blocks everything I try to compose after the first few sentences. I save the email then open again to try to get in a few more sentences before Copilot pops up again. Can I delete it?

<https://support.google.com/chrome/thread/321195905/can-i-remove-copilot-now-popping-up-when-i-try-to-write-emails?hl=en>

I am sorry to say that but Microsoft Copilot is not yet transforming the "Future of Work".

Here are the current Top 6 enterprise use cases of Copilot:

- Summarize very quickly what you already know.
- Turn bullet points into long paragraphs.
- Write emails that sound like a robot.
- Create action plans for nonexistent problems.
- Design unusable and unappealing slides.
- Make call transcripts sound like TED Talks.

This is not what I call the new wave of productivity.

6. - Privacy concerns among users

The issue for me is not Copilot itself, or whether it is on or off by default, it is the constant array of banners announcing it and begging me to use it for things that are truly stupid. Summarize an email? I can read it in less than a minute, and if I do not understand it, how is AI going to help.

I am also a bit concerned about giving Copilot access to this stuff, because I am a bit unclear on the privacy issues. Reading the ToS, Privacy Policy, and EULA doesn't help as they are all just weasel words.

<https://www.thurrott.com/forums/microsoft/windows/thread/going-away-from-microsoft-online-services>

@microsoft365 @microsoft Tell me a clear and easy way to get your unwanted, unasked-for AI copilot garbage off my computer and out of my documents. You had great products and I'm on my way to open source just to get away from your insistence on packing AI into everything I do with my keyboard. This should be opt-in at best. Instead you've made it a massive waste of my time and energy finding a way out of your AI theft and privacy labyrinth.

Copilot+ is gonna screenshot everything you do. Where's my privacy?

Discussion

Just when we're dealing with a privacy nightmare with tech companies, MS released another bombshell on it's consumers with a feature that will retain everything you do on a PC. Yeah we can stop it, but most people who aren't tech savvy like my grandma won't and it'll be a great opportunity for a hacker or a repairperson to look into the passwords and her bank account.

MS's history with privacy isn't good, we can't even turn off telemetry at this point.

https://www.reddit.com/r/Windows11/comments/1cyk3n8/copilot_is_gonna_screenshot_everything_you_do/?utm_source=share&utm_medium=web3x&utm_name=web3xcss&utm_term=1&utm_content=share_button

APPENDIX

The Copilot Trust & Effectiveness Guidelines

5.1 Core Principles

- 1. Every Copilot feature must be built with inherent transparency, allowing users to understand what's happening under the hood.**
 - Making data sources and decision criteria visible
 - Providing clear explanations for automated actions
 - Showing confidence levels for suggestions
 - Maintaining an accessible history of actions taken
- 2. Copilot should demonstrate continuous learning and adaptation while maintaining reliability.**
 - Starting with high-confidence basic capabilities before advancing to complex tasks
 - Building on established understanding rather than starting fresh each time
 - Showing clear evidence of improvement over time
 - Maintaining consistency in areas where accuracy has been established
- 3. Users must feel in control of their Copilot experience.**
 - Providing granular controls over automated behaviors
 - Allowing customization of risk tolerance levels
 - Enabling easy correction of mistakes
 - Respecting user preferences consistently
- 4. Copilot must maintain consistency and coherence across all M365 applications.**
 - Providing a single, unified personality and interaction model
 - Maintaining shared context and memory across modules
 - Ensuring consistent capability presentation
 - Using standardized interface patterns
 - Leveraging unified understanding of user preferences

5.2 Implementation Guidelines

Foundation Layer: Accuracy & Reliability

- Reduce hallucination
- Increase overall response accuracy
- Always allow users to give feedback on the accuracy of responses
- Prefer underconfident correct responses over overconfident incorrect responses

Intelligence Layer: Learning & Adaptation

- Design features to learn from user interactions
- Build persistent memory systems for preferences and patterns
- Implement feedback loops for continuous improvement
- Create clear interfaces for viewing and editing learned information
- Enable cross-feature learning where appropriate

Interface Layer: Transparency & Control

- Make automated processes visible and understandable
- Provide explanations for actions taken
- Build in mechanisms for reviewing and auditing actions
- Provide manual override for copilot automated features

5.3 Development Checklist

Transparency Requirements

- ☐ Can users easily understand what the feature does?
- ☐ Are data sources clearly indicated?
- ☐ Is the decision-making process explained?
- ☐ Can users track actions taken by the feature?

Accuracy & Trust

- ☐ Does the feature deliver reliable, consistent results?
- ☐ Are there clear indicators when content is AI-generated?
- ☐ Is there clear handling of scenarios where accuracy cannot be guaranteed?
- ☐ Is there clear communication when the feature is uncertain about something?
- ☐ Does the feature maintain trust by avoiding hallucinations or made-up information?

Learning Capabilities

- ☐ Does the feature learn from user interactions?
- ☐ Is learning persistent across sessions?
- ☐ Can users view and edit learned information?
- ☐ Does the feature demonstrate improvement over time?
- ☐ Are there mechanisms to identify and address common issues?

User Control

- ☐ Can users set boundaries for automated actions?
- ☐ Are there clear methods for correcting mistakes?
- ☐ Do users have granular control over feature behavior?

- ☐ Is there an easy way to disable or limit functionality?
- ☐ Are there clear channels for user feedback?

Discoverability & Adoption

- ☐ Is the feature easy to find and start using?
- ☐ Are capabilities clearly communicated?
- ☐ Is there appropriate guidance for new users?
- ☐ Is value clearly demonstrated during first use?

Risk Management

- ☐ Are there safeguards against critical errors?
- ☐ Is there a clear rollback mechanism?
- ☐ Are high-risk actions clearly identified?
- ☐ Is user confirmation required for significant actions?
- ☐ Does the feature fail gracefully when needed?
- ☐ Does it handle sensitive information appropriately?

Integration Requirements

- ☐ Does the feature maintain consistency with other Copilot capabilities?
- ☐ Is learning shared appropriately across features?
- ☐ Are user preferences respected consistently?
- ☐ Does the feature align with overall Copilot interaction patterns?
- ☐ Does the feature present a unified front with other Copilot experiences?
- ☐ Is context appropriately shared between Copilot experiences?
